

## Scotkartin 'Go Green' test - 26/02/08

Scotkart have teamed up with innovative fuel additive company 'Go Drive Green' to be the test facility for their new petrol additive which is designed to lower emissions, increase economy and improve performance from petrol engines. All the karts at Cambuslang are now running using the additive, and we are closely monitoring results to see if it offers our customers the benefits of improved air quality and even more throttle response from the karts. The Chemical differs from other additives which are just detergents, in that it actually makes the petrol burn cleaner.

More information can be found on [www.godrivegreen.com](http://www.godrivegreen.com), and an extract can be found below:

"G1 petrol treatment has been developed to improve the economy, ecological footprint and pleasure of your driving.

The fuel treatment enhances the smoothness and responsiveness of your engine. In older vehicles there is a noticeable reduction in engine noise too. These features build to add satisfaction to your driving experience.

Further the ecological improvements are delivered by reducing the pollutant emissions from your vehicle exhaust. Emissions of hydrocarbons, particulate and nitrogen oxides (NOx) are all reduced.

Fuel consumption is also reduced. With an improvement in fuel economy there is an additional environmental gain to be seen in a reduction in greenhouse gases, especially carbon dioxide (CO<sub>2</sub>)."
